

Genetics

The Code of Life: DNA & Genes

Genes are Instructions to Build Proteins

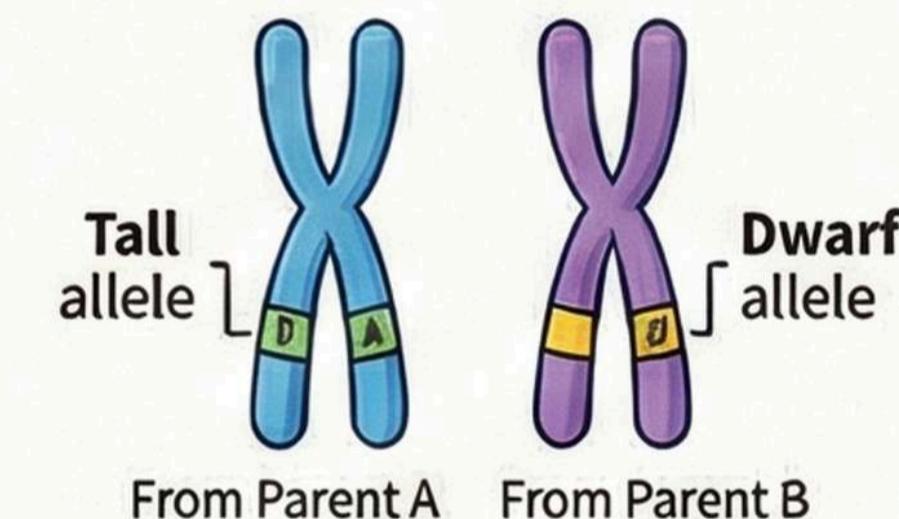

How Traits Are Passed Down: Heredity

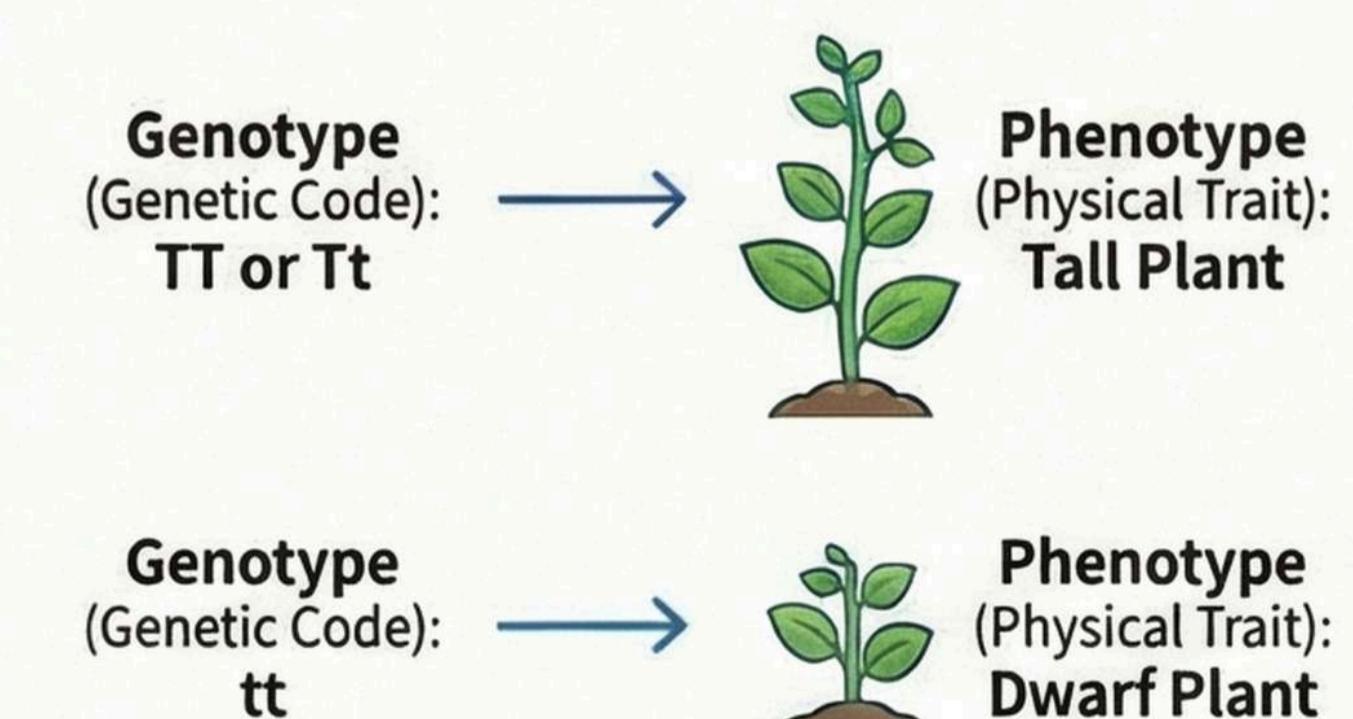

Mendel: The Father of Genetics

- Discovered:
- dominant traits (always show up)
 - recessive traits (can be hidden)

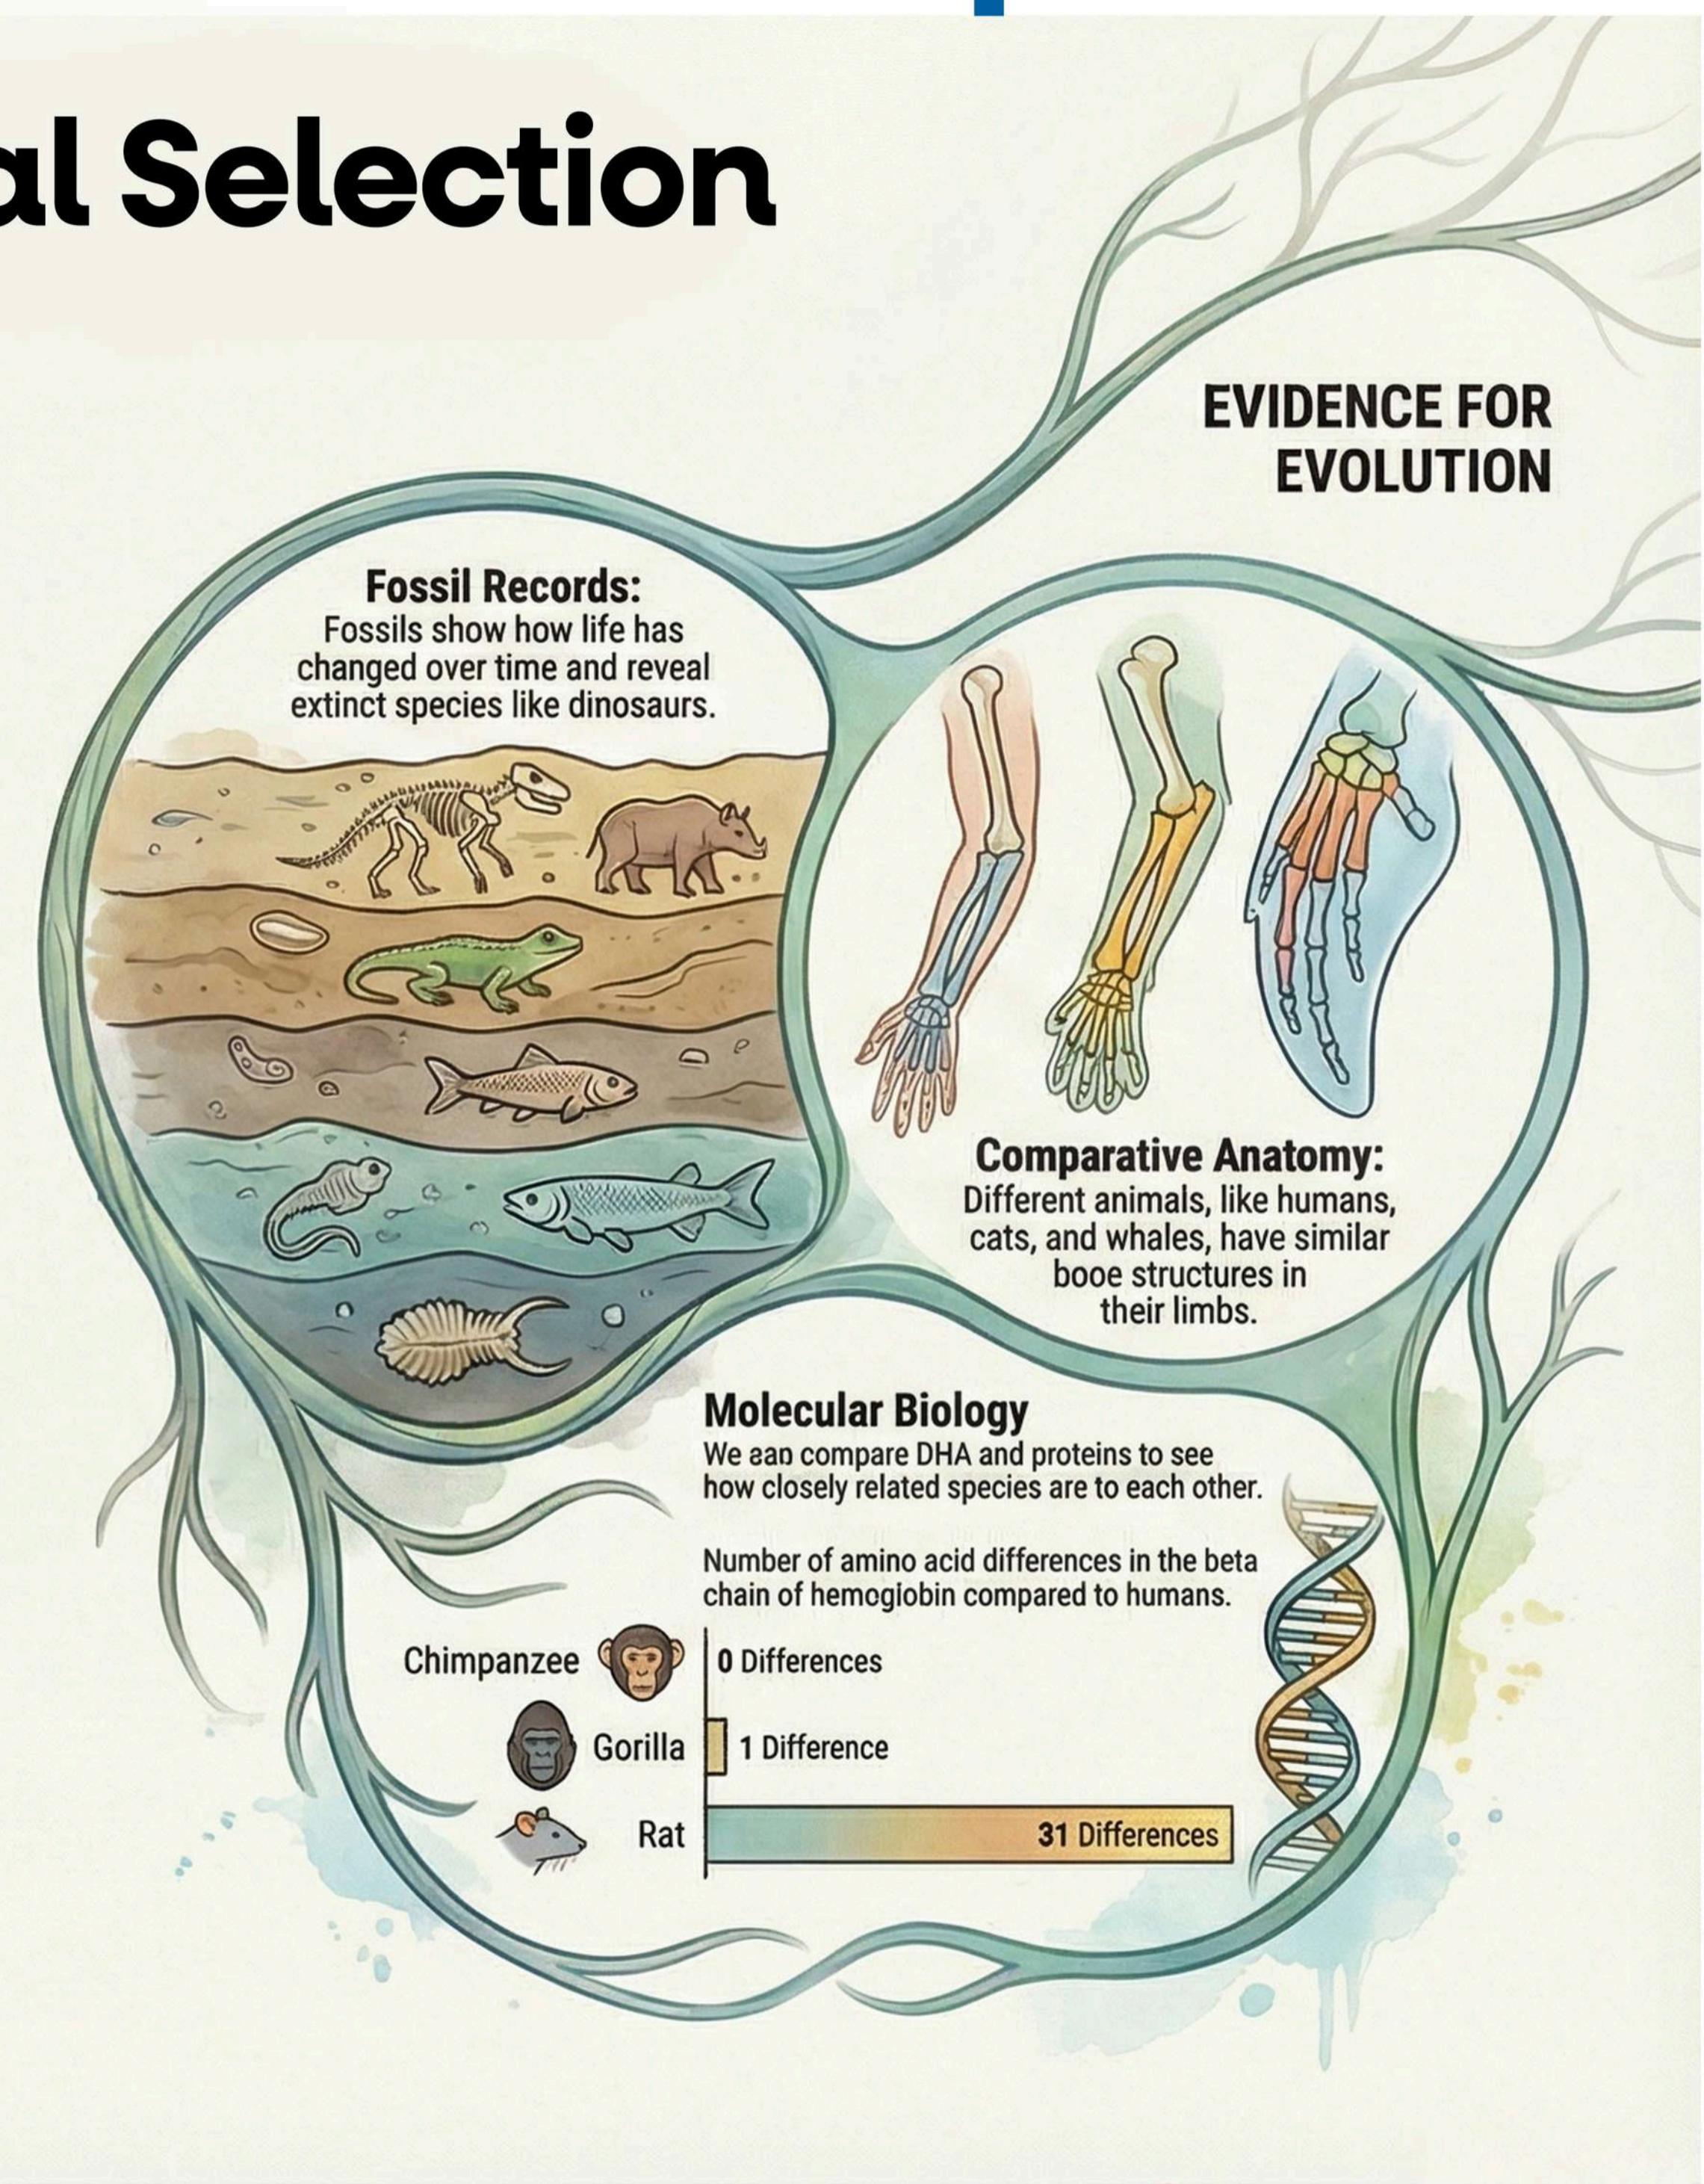

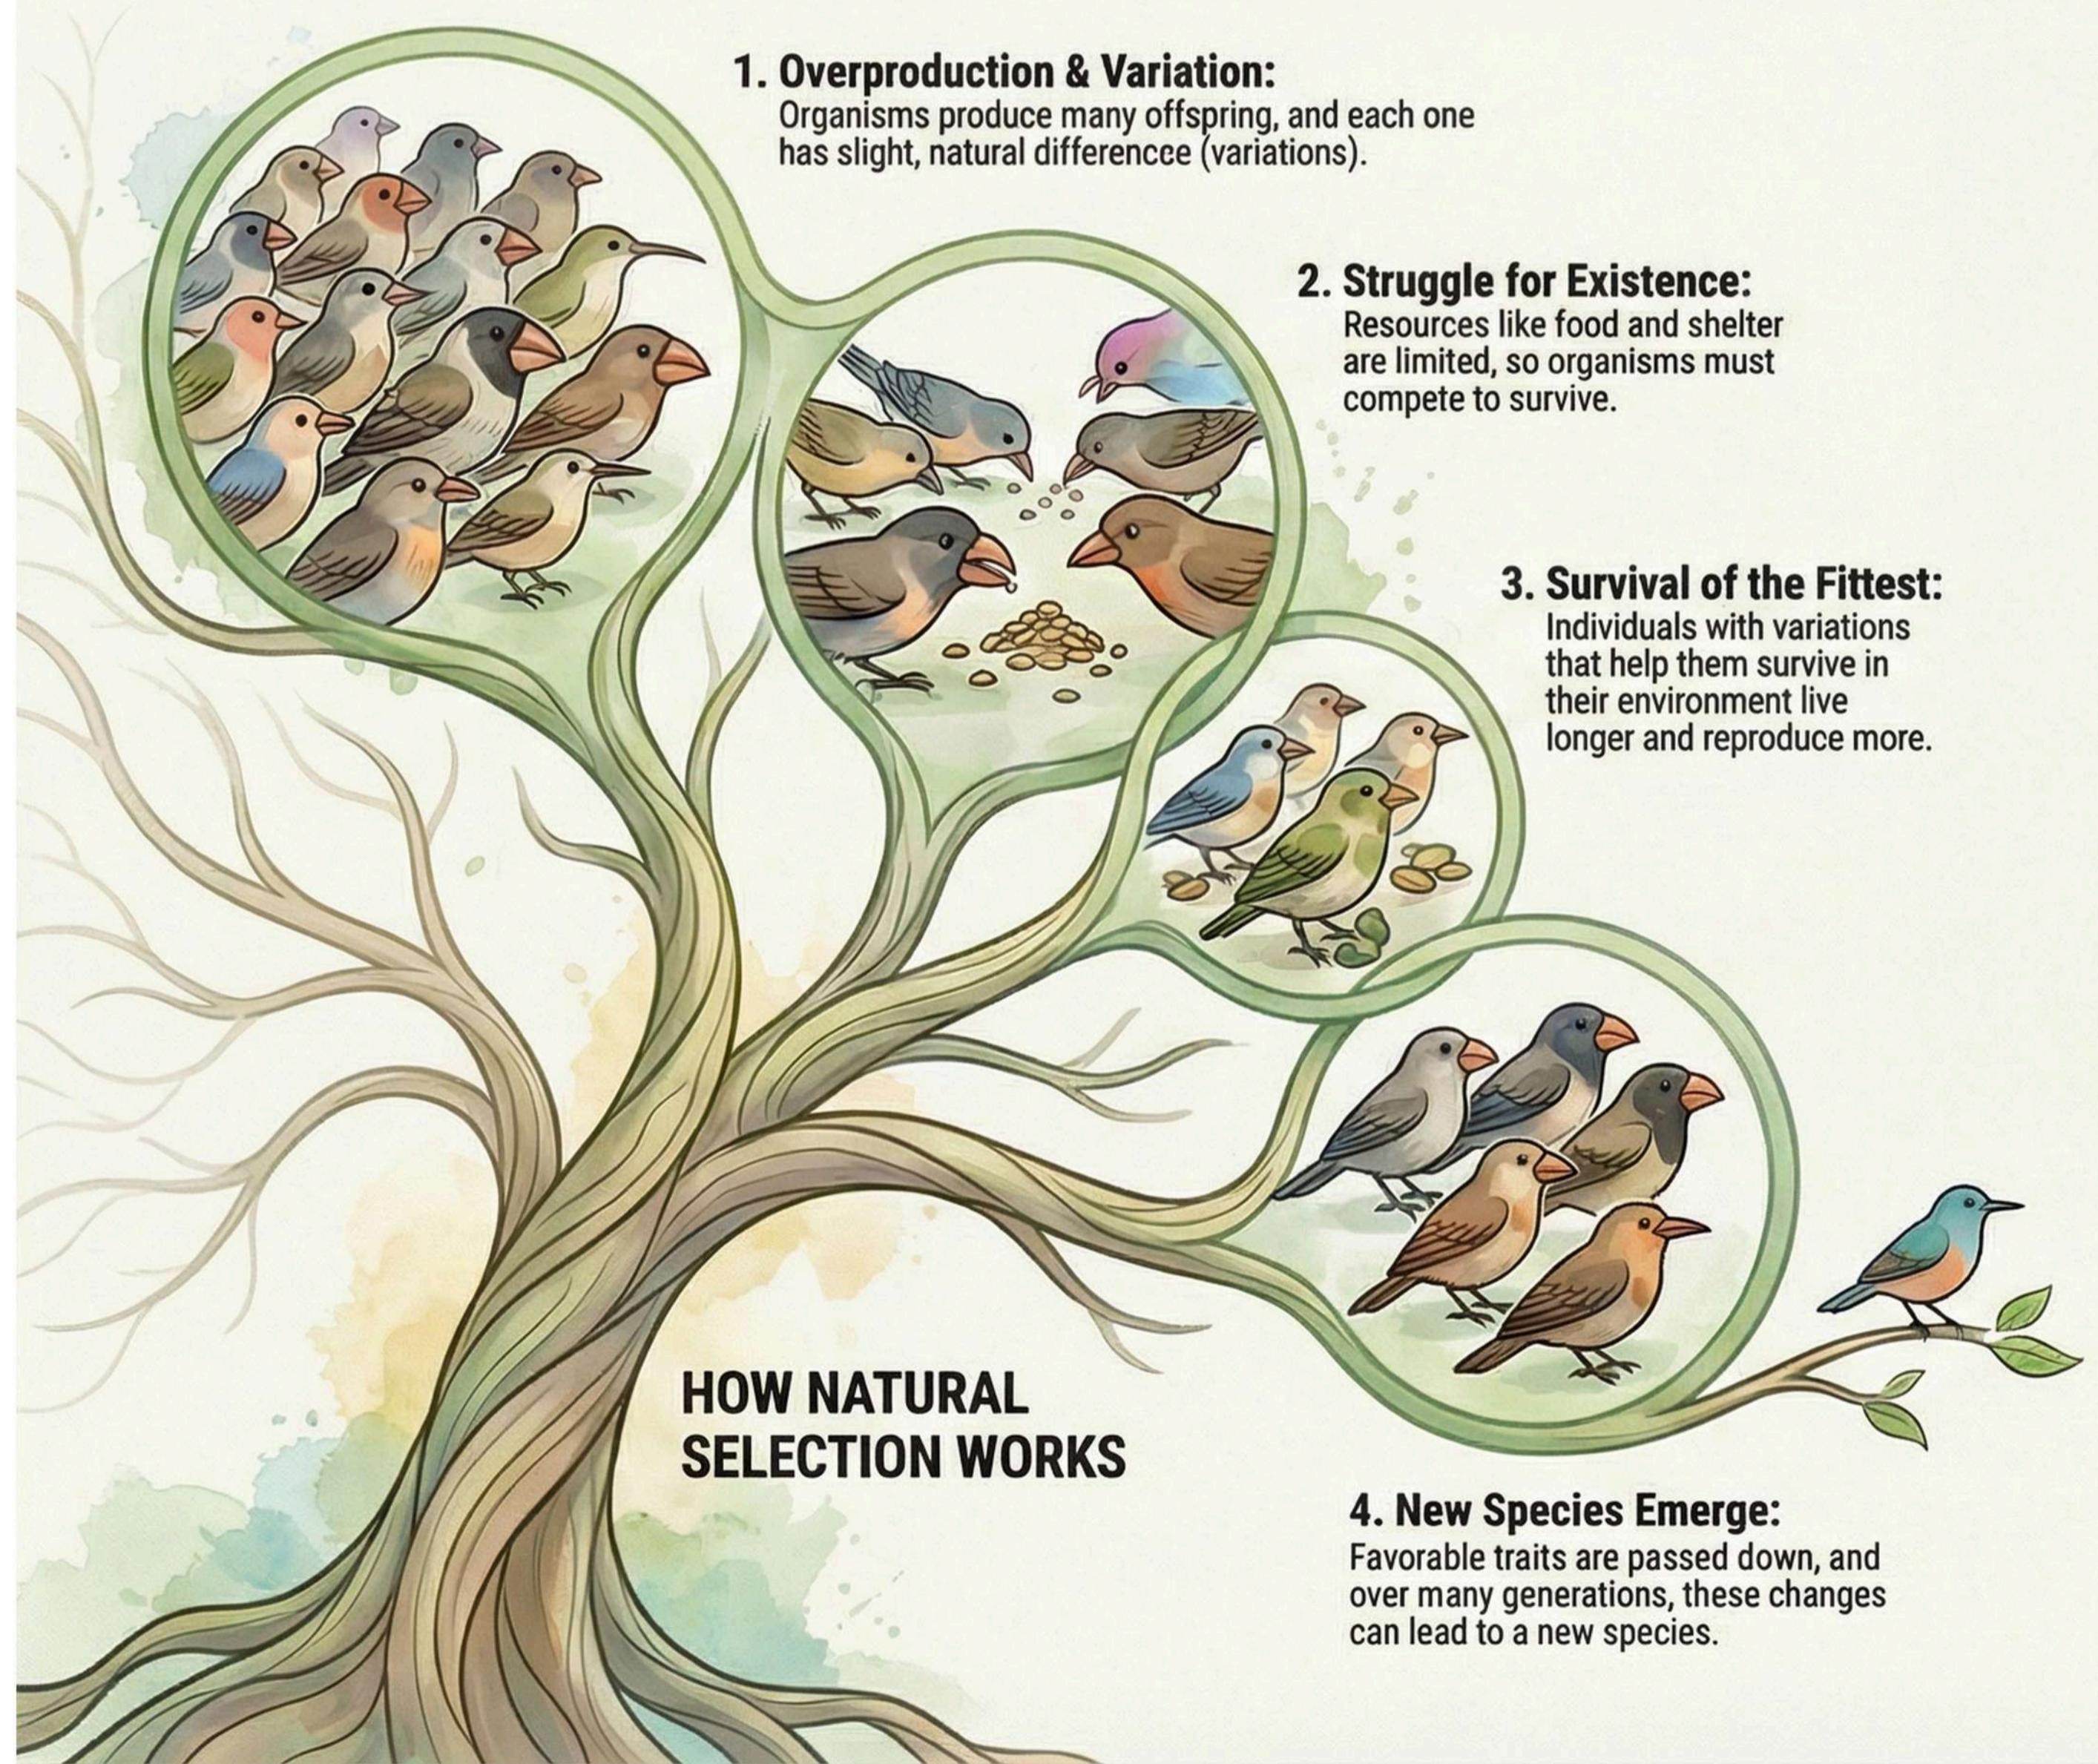

Alleles are Different Versions of a Gene

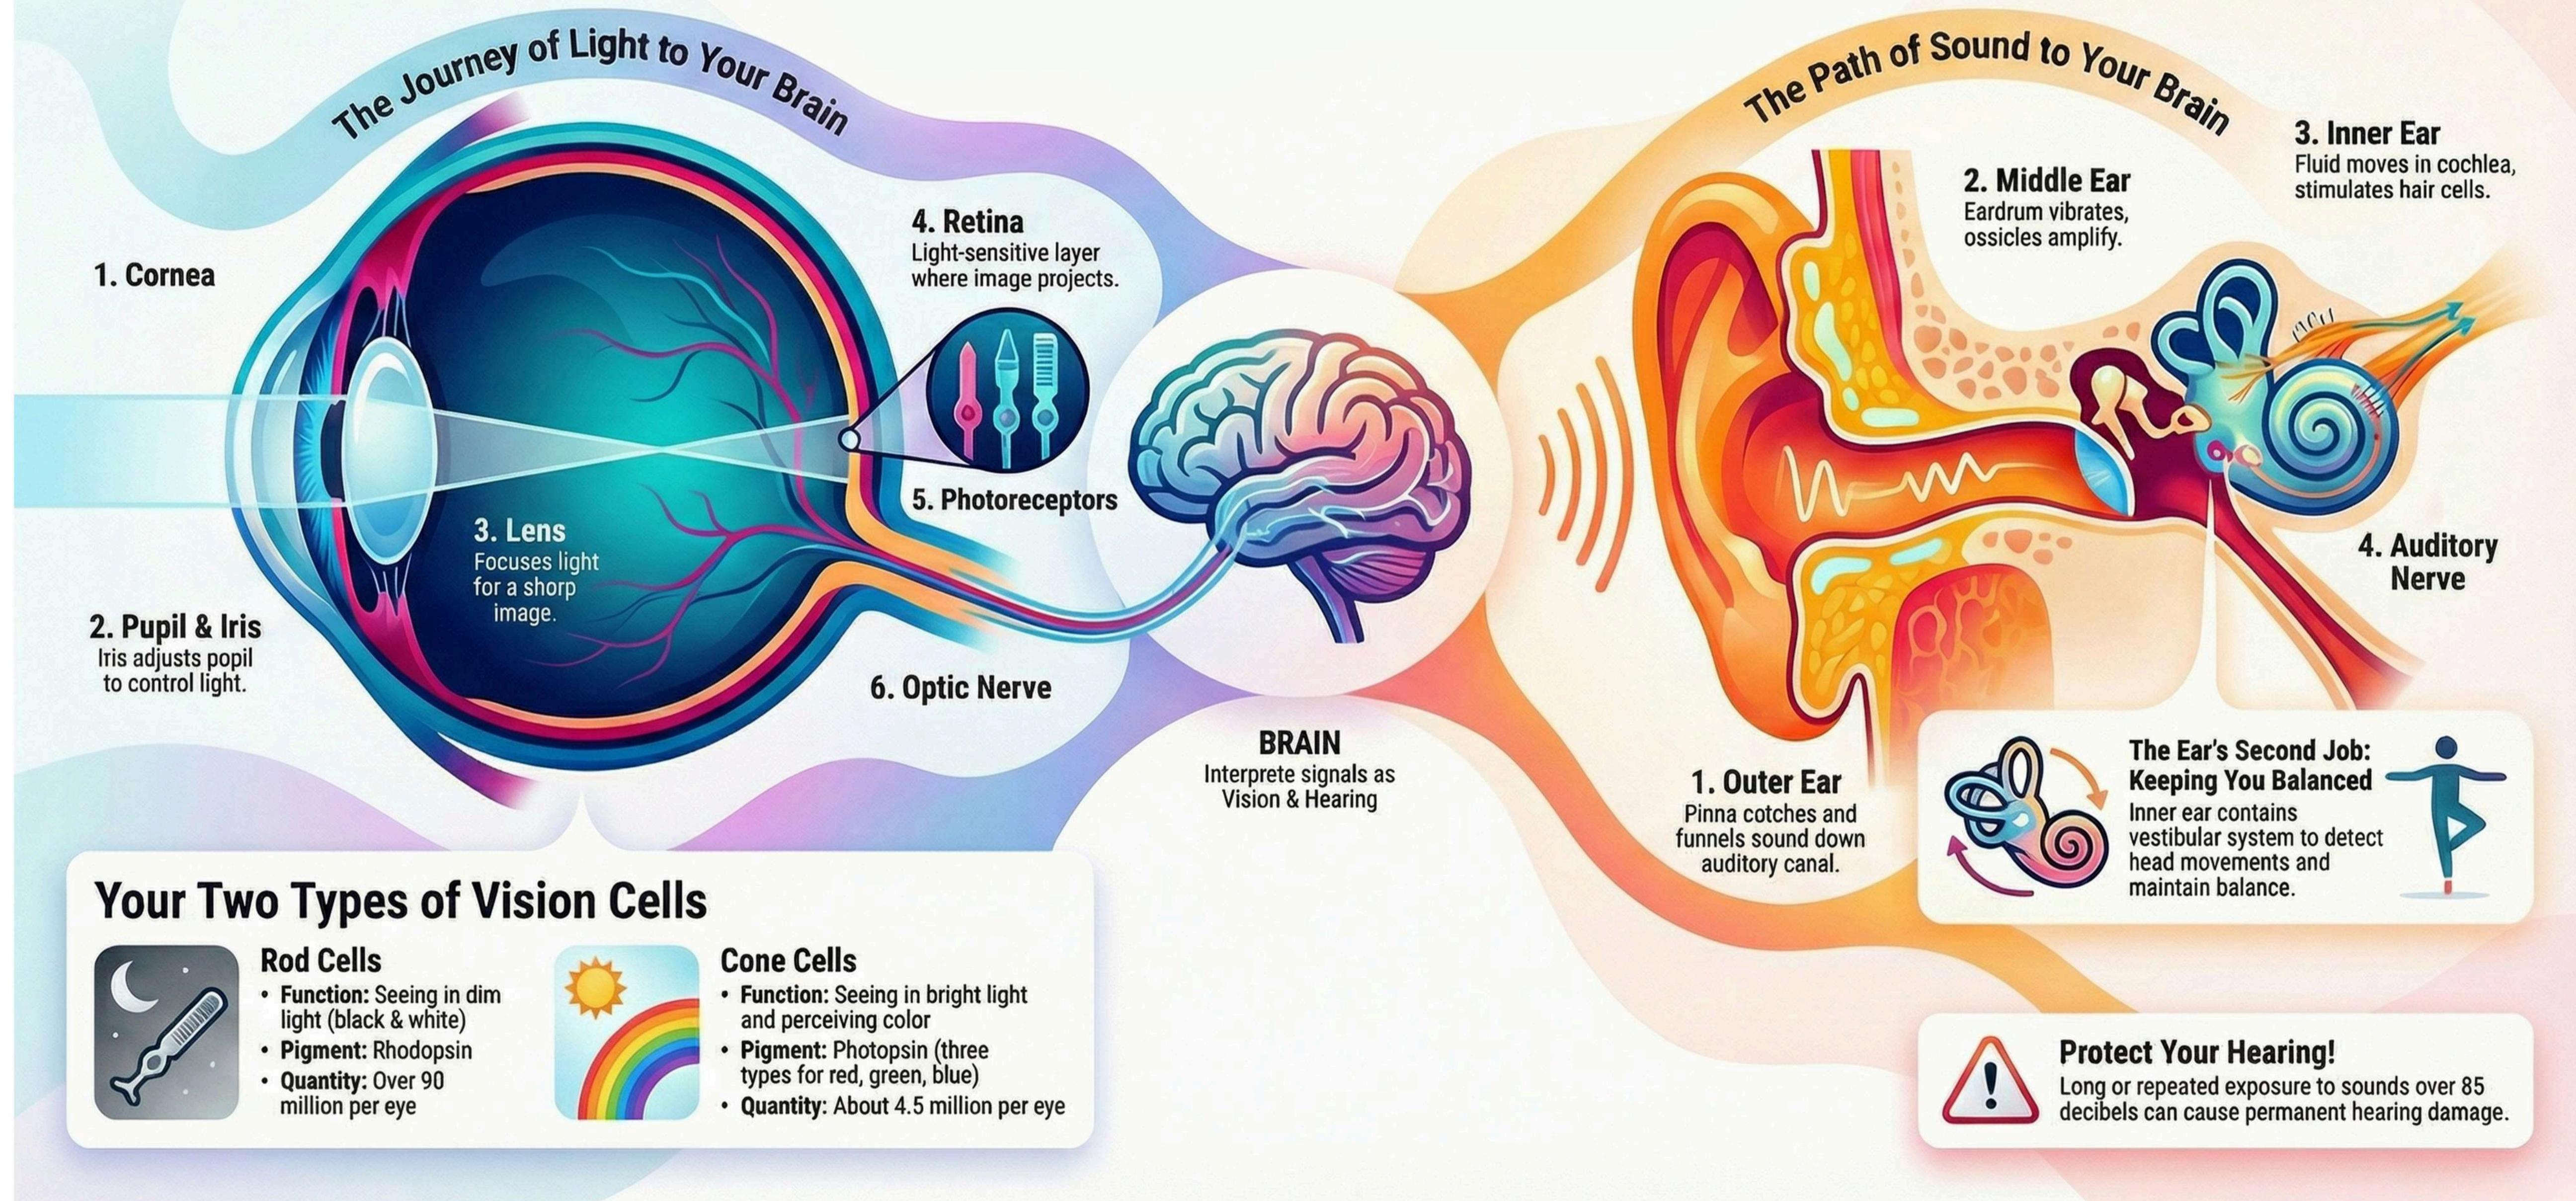

Genotype vs. Phenotype

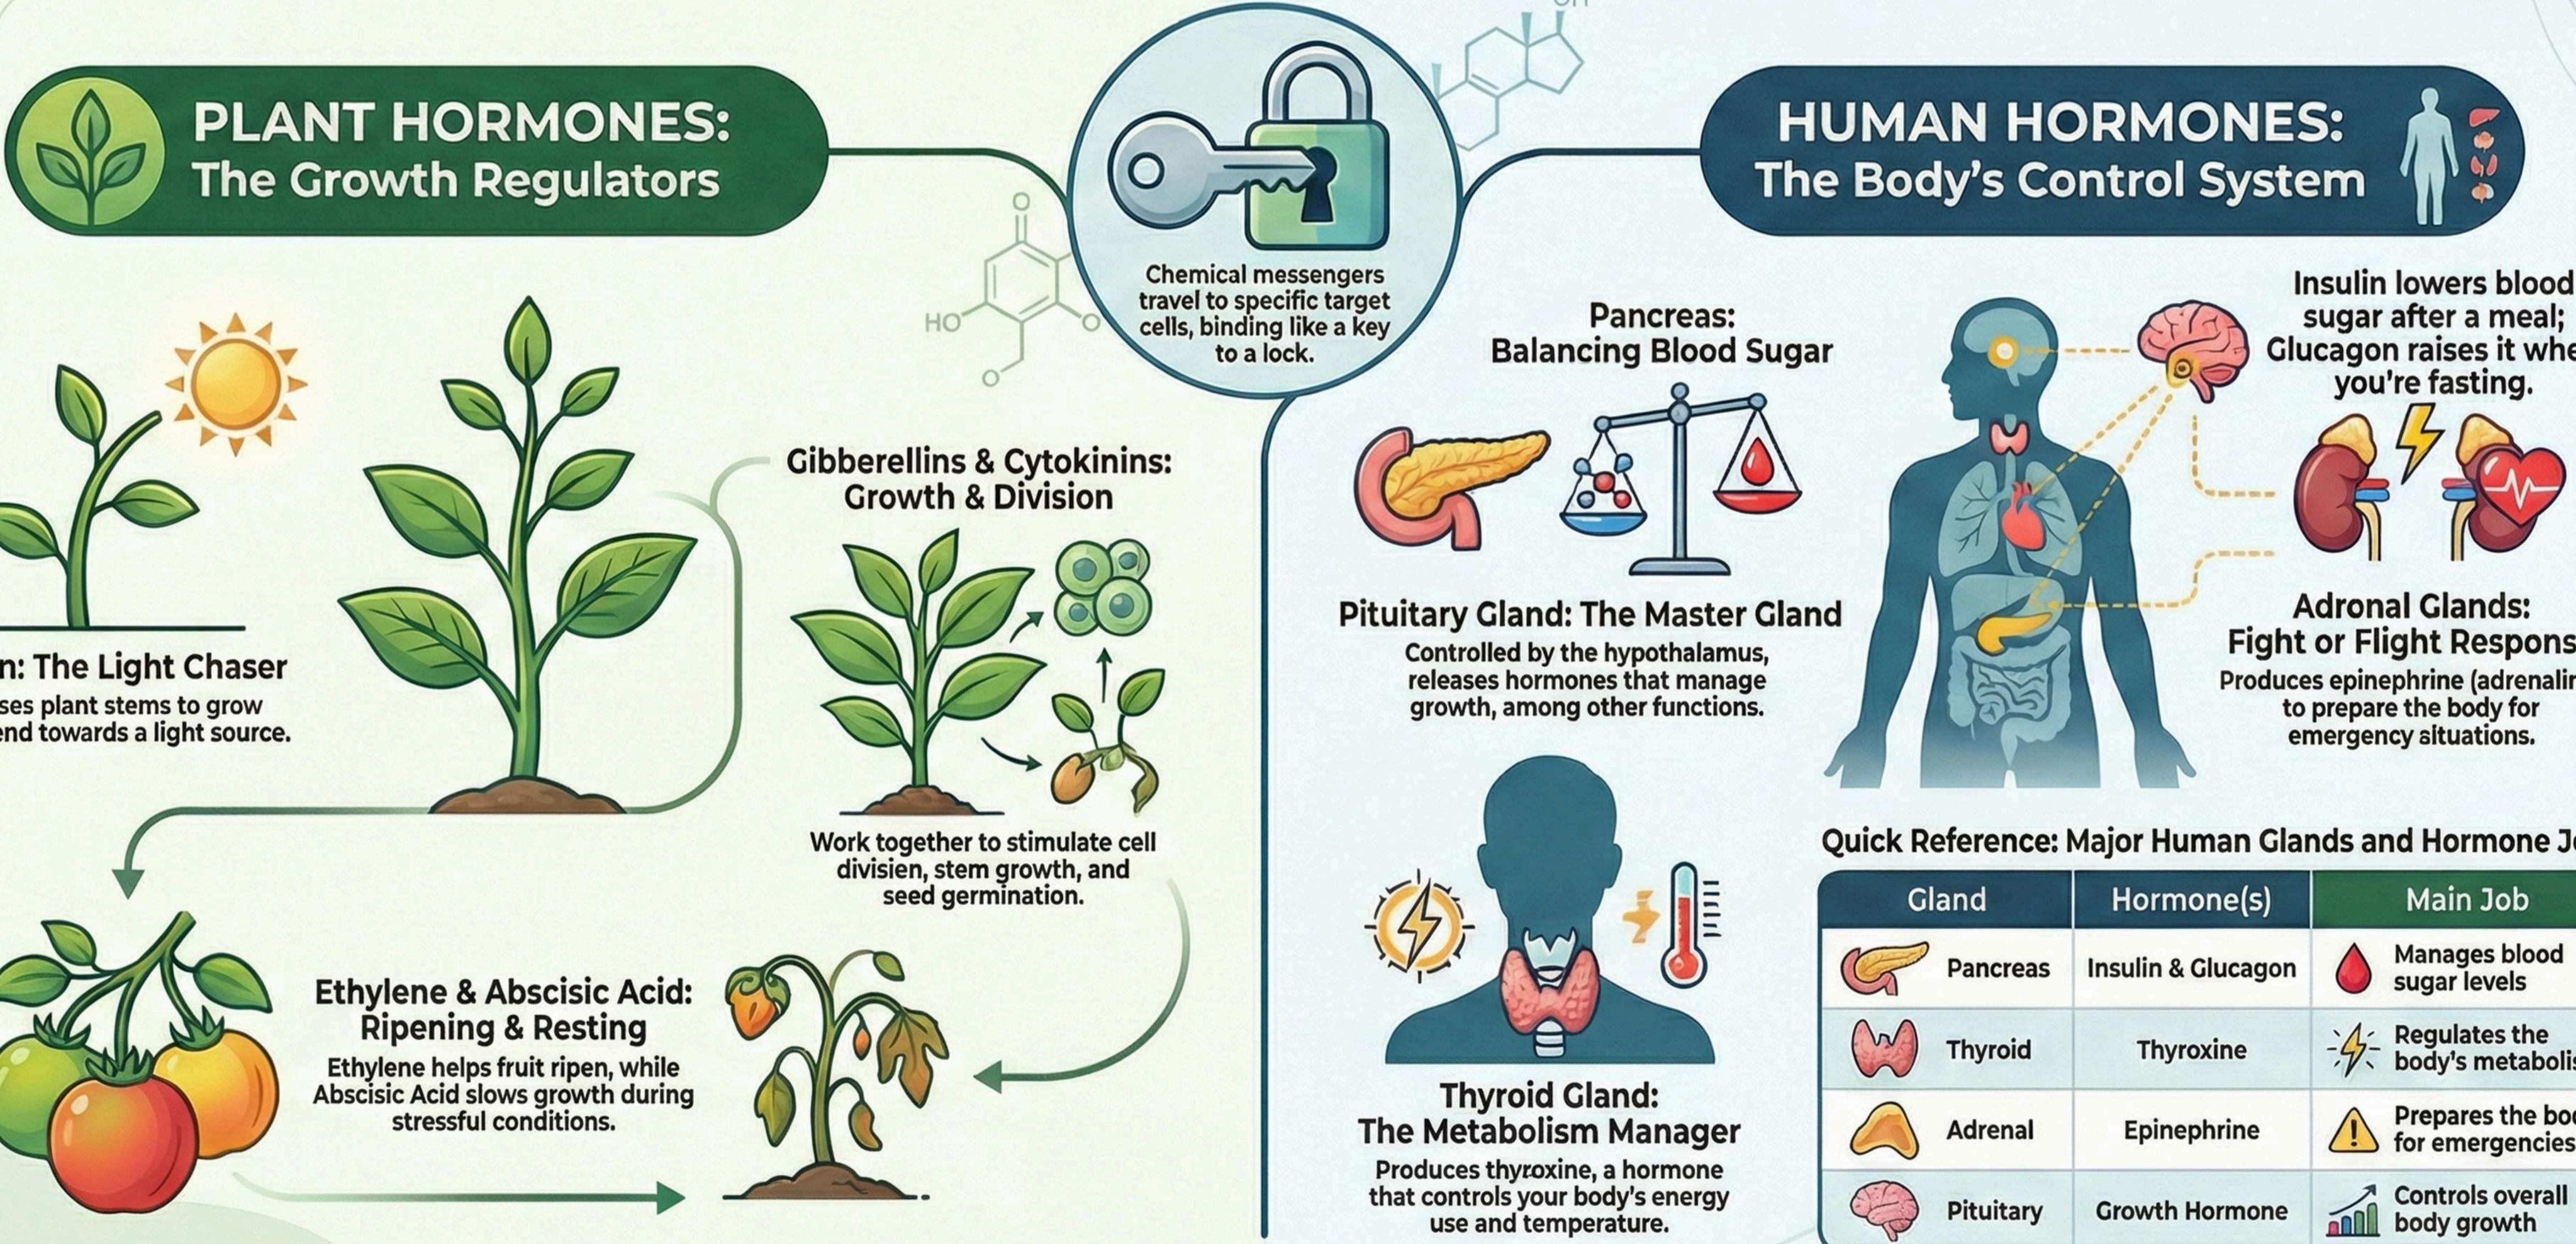

Evolution & Natural Selection

Chemical Messengers: How Hormones Control Plants and People

Body's Defenders

Our body has a powerful defense system called immunity, which protects us from harmful invaders known as pathogens. This system has different layers of defense to keep us healthy and fights off various diseases if we do get sick.

Our Immune System: The Body's Defenders

Innate Immunity: Your First Line of Defense
This is the natural protection you are born with, like skin, tears, and stomach acid.

Acquired Immunity: Your Body's Smart Defense
This immunity develops after birth, learning to fight specific germs it has met before.

Vaccination: Training Your Immune System
Vaccines use dead or weakened germs to teach your body to build defenses without causing sickness.

The Attackers: How We Get Sick

What Are Pathogens?
Pathogens are tiny organisms like bacteria and viruses that can enter the body and cause disease.

Pathogen Type	Example Disease
Bacteria	Tuberculosis
Virus	AIDS (caused by HIV)
Fungus	Ringworm
Protozoa	Malaria

Some diseases, like cancer or genetic disorders, are not caused by pathogens and cannot spread.
